Manitowoc QuietQube® Ice Machines

Production capacity 365 to 2,000 lb./day.

CVD (Cool Vapor Defrost) Technology

75% quieter than self-contained or standard-remote ice machines.This new patented technology uses cool vapor rather than hot gas to harvest ice, making QuietQube® ice machines the quietest ever. Standard remote condenser ice machines use compressor hot gas for ice harvest and require the compressor to be as close to the ice making evaporator as possible. The noise from the compressor is always concentrated at the ice making part of the system. CVD ice machines use vapor refrigerant from the receiver tank to harvest the ice. In a properly configured system, the receiver tank can be a source of vapor refrigerant for a harvest cycle. All CVD systems use large capacity refrigerant accumulators for maximum compressor protection under any operating condition.
